

PEOPLE
@WORK

Maximum efficiency with the lowest possible expenses.

Mobile management
of service employees

Optimisation of
work plans

Reduction of up to 40% in
the number of technicians

Logistical expenses
reduced by up to 30%

We have created a system
which genuinely allows you
to manage the efficiency of
processes

People@Work is a tool that offers you
the security of knowing that your people
are where they should be, know what
they should be doing, and are doing it well
and efficiently.

The more efficiently your firm operates, the
more satisfied your customers, and of course
your employees, will be. You will achieve this
effortlessly with People@Work thanks to the
clear layout and simplification of even the
most complex company processes.

People@Work is a system intended for organisations in all sectors
which share one thing in common: an interest in controlling and
clarifying processes and the related operating expenses and resources.

More accurate
logistics and
administration:

Better quality of data thanks
to data entry using mobile
equipment directly in situ.

Automatic creation of
optimised work plans for each
employee.

Minimal total administrative
tasks thanks to comprehensive
processing by an employee
directly on site.

Operative utilisation of mobile
warehouses, records of
materials consumed for specific
activities and integration
with the internal warehouse
management system.

“The system is fully used to
support the company’s Care
Business (the installation of
services with clients, operative
resolution of defects). Given
the requirements for gradual
start-up it is anticipated that
very soon the system will
be managing and planning
more than 600 vehicles and
resources.”

(Ing. Miroslav Majoroš,
Slovak Telekom)

Cleverlance

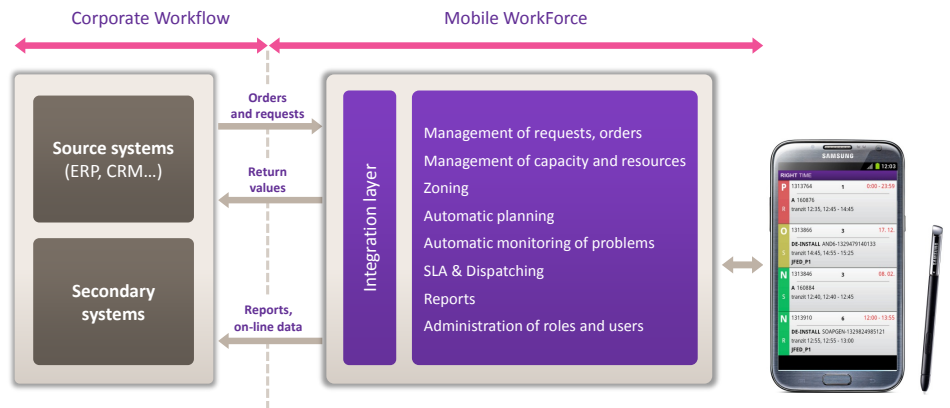

This solution, the only one of its kind on the market, offers you much more

- the product is compatible with internal ERP, CRM and workflow systems and has an interface prepared for most standard company IT systems (e.g. SAP, Siebel, Cramer, etc.)
- the system supports European Union legislation and respects the rules of ISO norms
- clearly arranged reporting is a standard feature of the system, and this allows for the ongoing evaluation of the efficiency of all operating elements of a firm and the processes underway in them
- the flexibility of all solutions allows companies to bring new services to market with complete systemic support of processes more quickly than their competitors

Right Time technology

The Right Time platform is designed so that it can be integrated easily and simply with commonly used ERP and CRM company systems and serves as a mobile client of the product P@W. A company employee receives access to company data via mobile telephone or tablet practically anywhere and from anywhere, even in an offline regime. All data is automatically encrypted using the AES 256 code in the client's protected database. With TLS/

SSL communication and a 2-factor authentication support the system meets the maximum security criteria for mobile applications in a corporate environment. As well as the increased effectiveness and control companies will appreciate the user comfort and accuracy of data entered. The data can be connected to a camera, GPS module or barcode reading application.

Improved customer service

- guaranteed implementation of key activities (e.g. installation and repair work) and speedier realisation by up to 40%
- the integration of work processes leading to a reduction in the implementation time of terrain-based activities by up to 30%
- the arrangement of a guaranteed visit time to the customer during a single conversation (OneStopShopping)
- the filing of an agreed order and immediate implementation of a new service directly on site

Reference

“The optimisation that the system has delivered means we have increased SLA implementation to clients to 95% against the original 84% and have made savings of 30% of the expenses prior to putting the system into productive operation.”

(Milan Schlezinger, Telefónica O2 CZ)
